Unique momentum for satellite remote sensing in agriculture

- EO response to operational agricultural applications:
 - Emerging collaborative initiatives endorsed by G20 in the context of GEO (AMIS, GEOGLAM)
 - JECAM initiative opening the door to move from local experiments to global solutions
 - CEOS support to global agriculture users requirements
 - US and Chinese efforts on 30-m global croplands mapping
 - **Sentinel-2 mission to finally reach agriculture expectations (jointly with Landsat-8 and Sentinel-1)**

Sentinel-2 for Agriculture

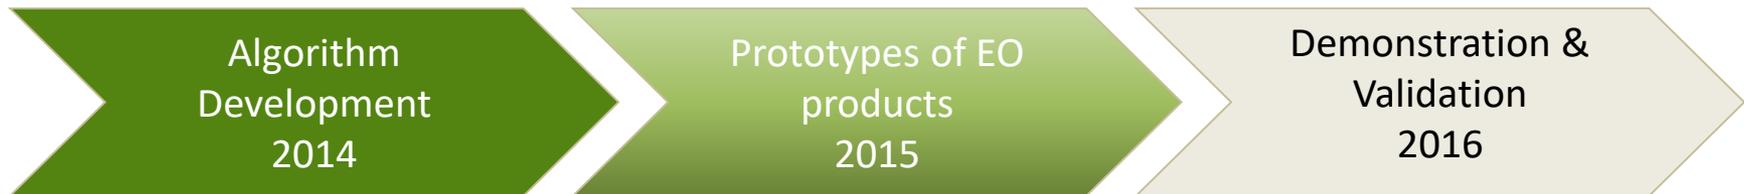

Launched by ESA in Feb. 2014

Objective:

- Preparation for national to regional agricultural monitoring based on Sentinel-2
- Consolidate best practices for EO agricultural monitoring
- Strengthening national capacity for agricultural monitoring

3-phase project over 3 years

User-driven approach

1st User Consultation organized by ESA in 2012

2nd User Consultation during the first months of the project through surveys

1 user workshop each year + training / capacity building activities

18 Champion Users + 13 Sites Managers

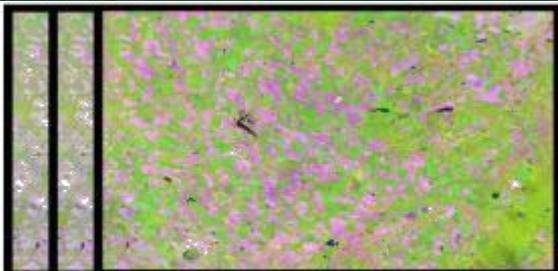

Toolbox for 4 S2-based products in line with the GEOGLAM core products

Monthly cloud free surface reflectance composite at 10-20m

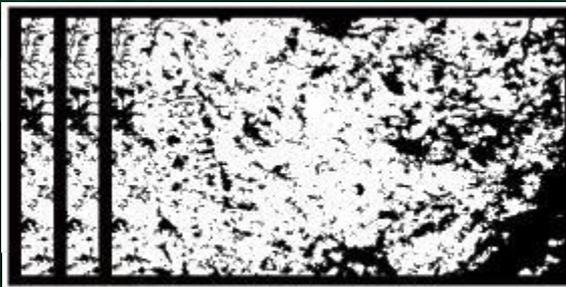

CLOUD FREE SURFACE REFLECTANCE COMPOSITES

Growing season (monthly updates)

Vegetation status map at 20m delivered every 10 days (NDVI, LAI, pheno index)

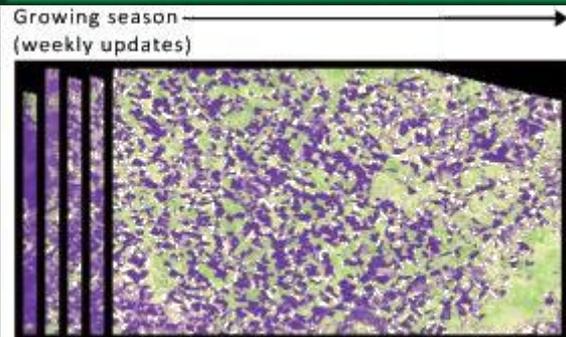

DYNAMIC CROPLAND MASK

Growing season (monthly updates)

Open source toolbox
Capacity building and training

VEGETATION STATUS

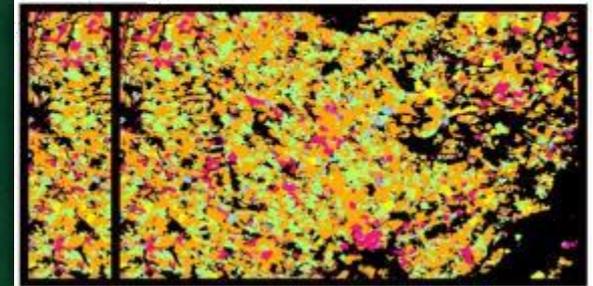

Growing season (weekly updates)

Binary map identifying annually cultivated land at 10m updated every month

CULTIVATED CROP TYPE MAP

Growing season (first half and end of the season)

Crop type map at 10m for the main regional crops including irrigated/rainfed discrimination

Benchmarking for a transparent and objective algorithms selection

Literature review

Test Data Set (EO + in-situ data)

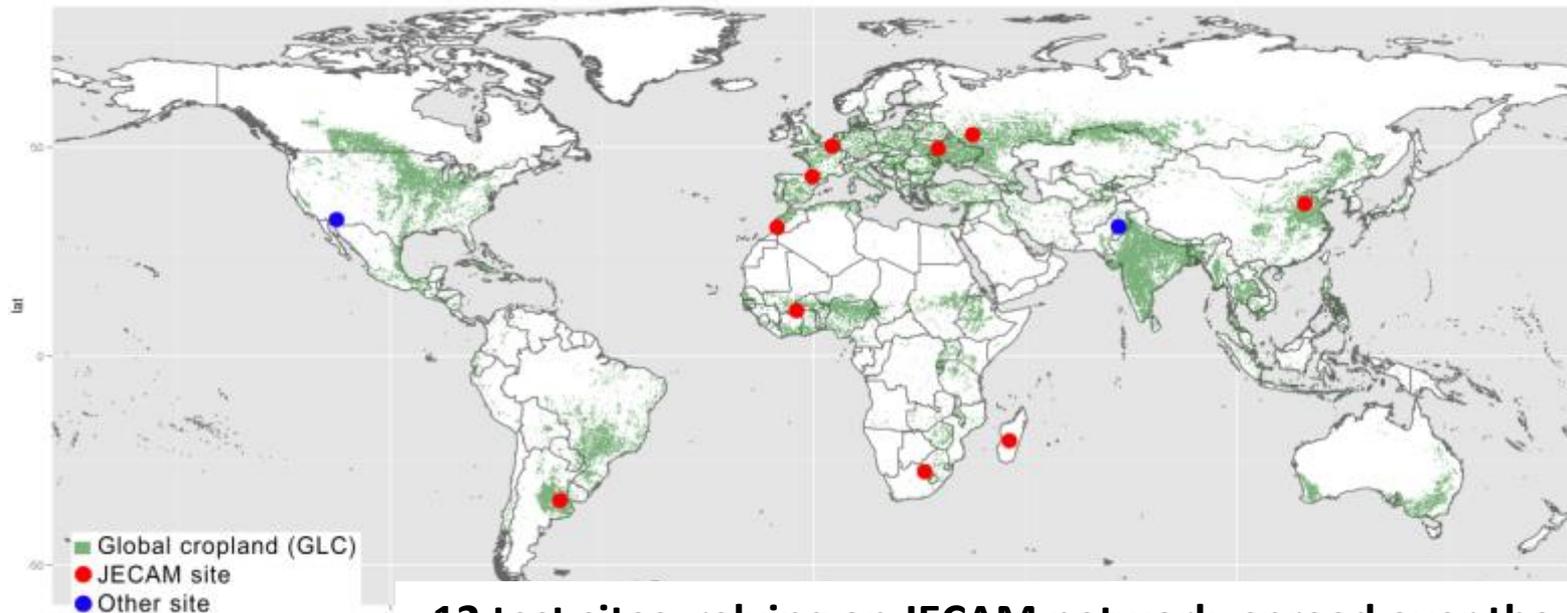

Scientific analysis

Select 5 suitable algorithms

Run the algorithms over 12 sites globally distributed

Compare results between algorithms and sites

Identify the best algorithms

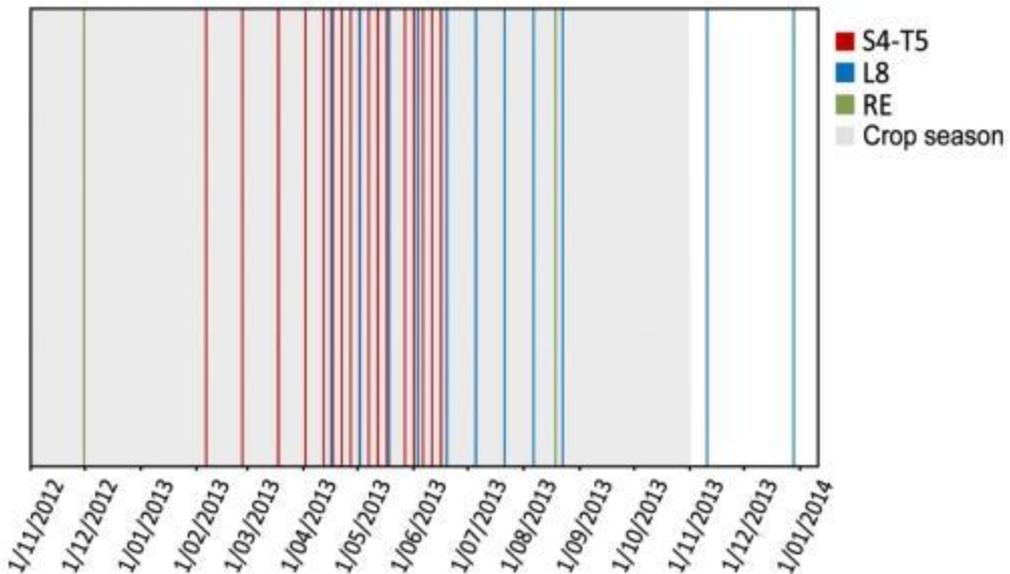

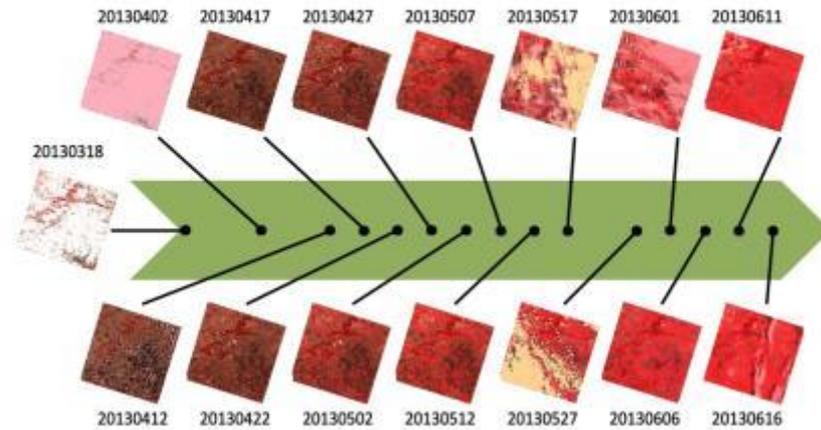

12 test sites, relying on JECAM network, spread over the world, which represent more than 17 major crop types

A unique dataset made of Sentinel-2 like EO time series and in-situ data

Site	S4-T5	L8	RE	Total
Argentina	12	11	15	38
Belgium	8	3	-	11
Burkina Faso	-	9	1	10
China	18	10	-	28
France	32	8	-	40
Madagascar	12	15	2	29
Morocco	24	16	-	40
Pakistan	-	13	1	14
Russia	-	5	6	11
South Africa	23	15	26	64
Ukraine	17	11	2	30
Maricopa (US)	54	15		69
Total of dates	200	131	53	384

SPOT 4 (Take 5) images building the time series for agriculture monitoring over the JECAM site of Ukraine

sentinel-2

A unique dataset made of Sentinel-2 like EO time series and in-situ data

Site	In-situ (2013)	Reference map
Argentina	Crop (108); No crop (39)	Global land cover GLC30
Belgium	Crop (31244); No crop (78156); GAI, PAI, FAPAR, FCOVER	SIGEC 2012, Land Cover CCI
Burkina Faso	Crop (496); No crop (101)	Global land cover GLC30
China	Crop (54); No crop (22)	Global land cover GLC30
France	Crop (1500); No crop (7659); GAI, PAI, FAPAR, FCOVER	RPG 2012, Land Cover CCI
Madagascar	Crop (221); No crop (101)	Global land cover GLC30
Morocco	Crop (636); No crop (500); LAI	Land Cover CCI
Pakistan	Crop (228); No crop (54)	Global land cover GLC30
Russia	Crop (205); No crop (56)	Fields delineation based in Landsat provided by the site manager, Land Cover CCI
South Africa	Crop (120); No crop (44)	Water bodies SRTM-SWBD, SADC Landcover Dataset (2000), Land Cover CCI
Ukraine	Crop (221); No crop (56); GAI, PAI, FAPAR, FCOVER	2010 classification map (30 m) provided by site manager
United States	Crop (4907); No crop (11351)	USDA data layer

Dynamic cropland mask

- Binary map, updated every month, identifying the annual cropland according to JECAM definition*

The annual cropland is a piece of land of minimum 0.25 ha (minimum width of 30 m) actually sowed/planted and harvestable at least once within the 12 months after sowing date, which produces an herbaceous cover possibly combined with a tree cover*

* the herbaceous fCover should reach at least 30 % and a maximum woody (height > 2 m) fractional cover of 20% is considered

There are 3 known exceptions:

1. the sugarcane plantation and cassava crop which are included in the cropland class although they have a longer vegetation cycle and are not yearly planted;
2. taken individually, vegetables consisting as contiguous small plots do not meet the minimum size criteria of the cropland definition. However, when considered as a continuous heterogeneous field, they should be included in the cropland;
3. the greenhouse crops that cannot be monitored by remote sensing and that are thus excluded from the definition.

L4 dynamic cropland mask

Properties	User Requirement	Product specification
Spatial coverage	Local (over sites) to regional	✓
Time period	Current	✓ with 6 months before the 1st delivery
Temporal frequency	1 month	✓ 1 month with a 12-month moving window (fully operational after 23 months)
Delivery time	3 days after the end of each month	✓
Spatial resolution	10 meters	✓
Legend	Binary (crop – no crop)	✓ focusing on annual croplands
Geometric accuracy	Sub-pixel location error	L1C geometric accuracy
Thematic accuracy	10 % (maximum error of omission and commission of annual cropland mask)	F1-Score of 50% at the middle of the season and 80% at the end of the season
Quality flags	(i) the number of valid observations (ii) the status of the pixel (valid, cloud, cloud shadow, snow, gaps and filled values)	✓ Info split in 4 flags (obs. number, validity, status, gap filled)
Format	Standard raster format (e.g. GEOTIFF)	✓ GEOTIFF
Projection	UTM and WGS84	✓ UTM-UPS/WGS84
Metadata	Clear metadata, standard data formats	✓ XML file
Products distribution	Open and freely available product (+ documentation and validation)	✓

Benchmarking set-up

- 2 modes:
 - 1) With in-situ data: supervised algorithm based on SVM / RF classifiers
 - 2) Without in-situ data:
 - a) K-mean classification + labelling based on an existing map
 - b) Cleaning of an existing map using a trimming process, to derive training dataset to feed a supervised algorithm (ML / RF)
- Per-pixel vs per-object approach (objects used before or after the classification)
- Assessment criteria:
 - Overall accuracy + crop / no-crop F-Scores (threshold of 50%/80% at the middle/end of the season)
 - Computation time
- Validation based on in-situ:
 - 1/3 for algorithm training, 2/3 for validation
 - Split by field
 - Split made 10 times to reduce variability (mean OA and F-Scores)

* Local (national) reference map

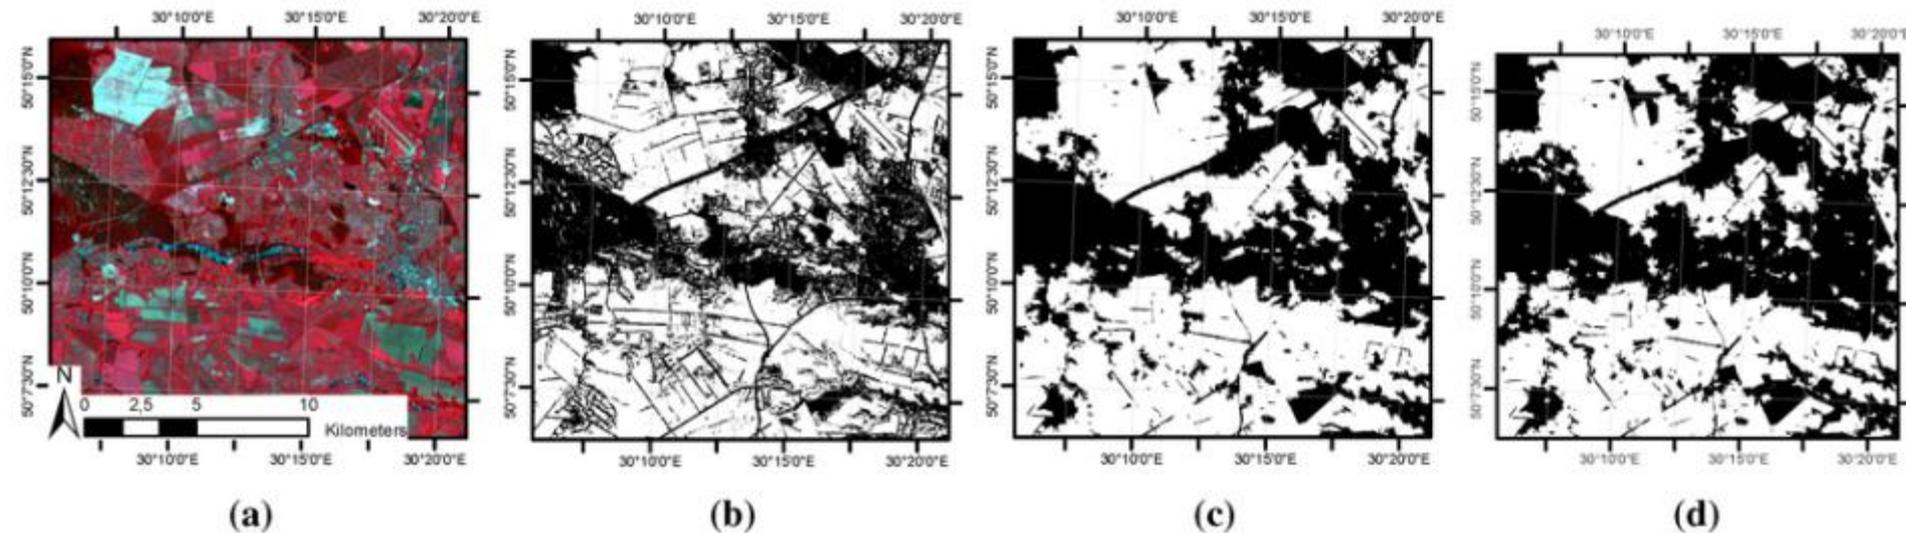

** Global reference map (GLC30)

Matton et al. (2015)

Object-based approach for a posteriori filtering

Objects resulting from mean-shift segmentation, applied to 6 first components (PCA on full NDVI times series)

- a) SPOT 4 (Take 5) image, 11 June 2013
- b) Pixel-based classification: salt and pepper effect preventing sharp field delineation
- c) Object post-filtering approach: dual approach combining both aspects
- d) Object-based classification: higher spatial consistency

Matton et al. (2015)

Objects don't increase OA, but improve spatial consistency of maps

Benchmarking conclusions

- Supervised approach leads to higher OA than unsupervised, but performance of unsupervised not bad
- Increased OA over time but already $\sim 80\%$ after 6 months
- Per-object approach most efficient for a-posteriori filtering

Implementation in the Sen2-Agri system

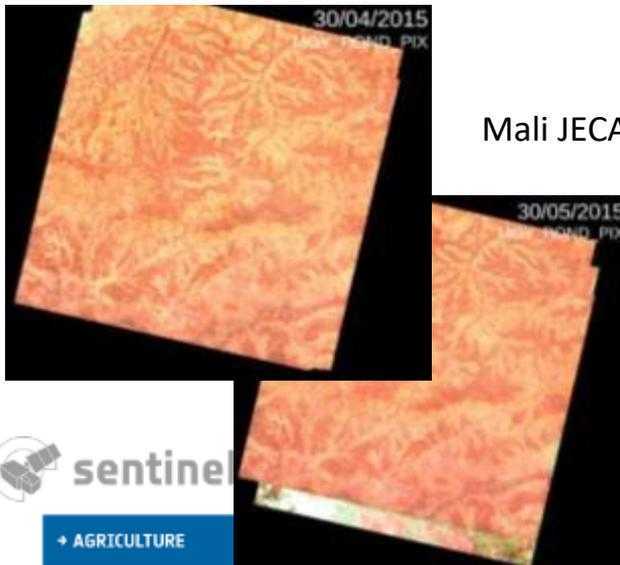

- 2 chains implemented to deal with presence/absence of in-situ data
- RF supervised algorithm
- Trimming to clean an existing map -> training -> RF supervised algorithm
- A posteriori smoothing based on a per-object approach

Successful development thanks to
JECAM collaborative network

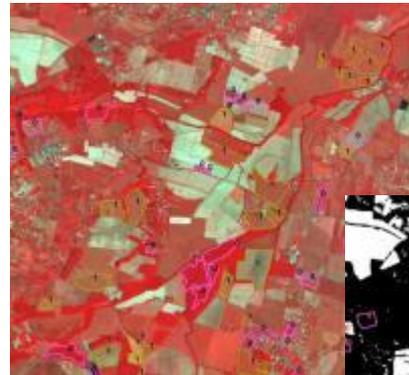

Next steps

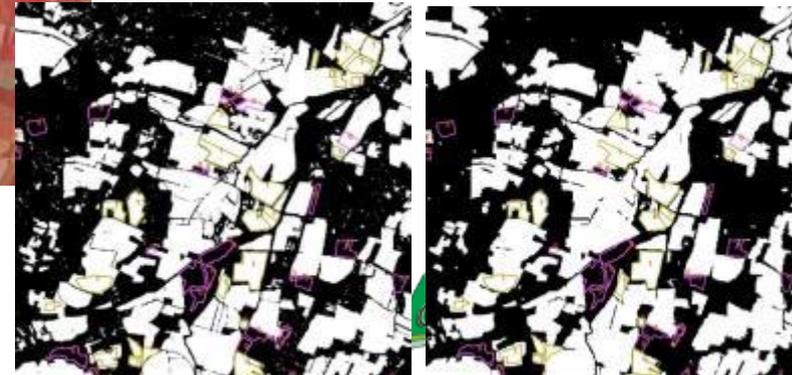

- Cross sites assessment allows testing methods robustness and relevance in different agricultural conditions
- Same assessment in progress with SPOT 5 Take 5 data (8 sites)
- Demonstration of the system (i.e. of the selected algorithms and developed system) from February 2016 in real-life conditions, with S2 data in NRT (presentation Tuesday 2PM)

Mali JECAM site

Overview Partners Test Sites Products Publications Project Team Forum

Sentinel-2 for Agriculture with SPOT 5 Take 5

The end of life of the SPOT 5 satellite, planned in a few weeks, and the success met by the SPOT 4 Take 5 experiment two years ago encouraged reinitiating this last operation.

Thanks to an ESA-CNES cooperation, SPOT 5 has been placed in a 5-day orbit on April the 2nd, allowing to acquire a new Sentinel-2 like dataset. The experiment started on April the 8th with the first image acquisition and will last 5 months until September the 8th. The first L2A images should be released by CNES early June. From this date, there will be a continuous data stream characterized by a 2-week delay between the image acquisition by the sensor and the L2A image availability.

130 sites will be observed, including 8 sites for our project located in Belgium, Burkina Faso, China, France, Mali, Russia, South Africa and Ukraine. All these sites are part of the JECAM network, which ensures an dataset of in-situ measurements during this season.

Over these 8 sites, we will generate our 4 key products: monthly composites, dynamic cropland mask, crop type map and LAI products. Over the French and Malian sites, this production will take place in near-real time from June while the products over the other 6 sites will be generated in autumn.

That will provide us with an extra possibility to run and test our algorithms. Most importantly, it gives us the unique opportunity to cover the growing season 2015 in the Northern Hemisphere and thus, to smooth the transition with the first Sentinel-2 data.
